## How it Works

ParkUSA®'s Bar Screen System captures unwanted floatable pollutants from wastewater and storm sewer systems. In the unit, the influent will encounter a floatable collection bar screen that traps debris as small as 1½" in size, preventing them from invading sewers, rivers, drainage swales, lakes, bayous, estuaries, and coastal waters. The separated effluent will exit the Bar Screen System and continue through the system, leaving behind the debris.

Bar screens are ideal for facilities which have a full maintenance staff. The bar screen is designed for ease of maintenance while maximizing safety. The Bar Screen™ consists of a structural concrete vault assembly with a preformed channel. The channel is placed at the flowline elevation of the inlet and outlet sewer pipe connections (typically at 3' to 8' below grade). Within the channel, vertical stainless-steel screens are positioned at an inclined angle. Screen openings are typically ½" to 2". Often, multiple screens are used with progressively smaller screen openings.

Visit [barscreen.parkusa.com](http://barscreen.parkusa.com) for more information and design assistance.

## System Components

The Bar Screen system is comprised of the following basic components:

- Precast concrete structure w/ access hatchways or grating
- Stainless steel platforms & screens
- OSHA approved ladders, handrails, & hoists
- Protective surface liners
